

REIKA

Great Upturn at REIKA

Despite the corona pandemic and the associated economic problems, REIKA managed a successful start into the year 2021 with its expanded product range and a good portion of employee motivation. Starting with the move into the new office building including the factory extension in February, the company took rapid steps towards an upswing in the spring. The significant growth rate among German automotive suppliers made itself strongly felt at REIKA with new machine orders in the first half of the year. REIKA's systems consistently impress with their precision, reliability and, above all, with their customer-specific solutions. Due to the unique selling points of the systems, REIKA is able to expand the production of the companies so reliably and cost-effectively. The long-standing regular customer VW Wolfsburg AG has already been successfully using this technology in its production halls for more than 15 years and thus produces more than 50 - 60 million blanks for constant velocity joints per year on six REIKA lines. The group as well as other suppliers have already announced new inquiries for the expansion of their production. Reika is therefore looking positively and confidently overall to the coming half year as well as to the coming year 2022.
